

Screenshot for xampp

Description:

First, I installed Xampp into my local machine. By using windows search I opened Xampp portal. In that I have started the webserver Apache and tomcat. While starting Apache it is stopped automatically because of port issues. So, I configured port to custom port number 1234. After starting the web servers, I go to web browser and entered localhost:1234 in address bar automatically xampp dashboard is opened in web browser. Then I have created html application and named it as demo.html and I did put it into the xampp htdocs folder. Then I have run the html application using localhost:1234/demo.html. we can see the above screenshot for output.
